NAME

MARC::File - Base class for files of MARC records

VERSION

Version 1.13

```
$Id: File.pdf,v 1.1 2002/12/02 21:41:04 edsummers Exp $
```

SYNOPSIS

```
use MARC::File::USMARC;

my $file = MARC::File::USMARC->in( $filename );

while ( my $marc = $file->next() ) {
    # Do something
}
$file->close();
undef $file;
```

EXPORT

None.

METHODS

in()

Opens a file for input.

next()

Reads the next record from the file handle passed in.

skip()

Skips over the next record in the file. Same as `next()`, without the overhead of parsing a record you're going to throw away anyway.
Returns 1 or undef.

warnings()

Simlilar to MARC::Record and MARC::Batch, warnings() will return any warnings that have accumulated while processing this file; and as a side-effect will clear the warnings buffer.

RELATED MODULES

MARC::Record

TODO

- `out()` method
  We only handle files for input right now.

LICENSE

This code may be distributed under the same terms as Perl itself.
Please note that these modules are not products of or supported by the employers of the various contributors to the code.
